# 1. How do WordPress is developed?

---

- どうやって開発されているの？ -

The screenshot shows a web browser window with the URL [make.wordpress.org](http://make.wordpress.org) in the address bar. The page has a dark header with the WordPress logo and navigation links for Showcase, Themes, Plugins, Mobile, Support, Get Involved, About, Blog, and Hosting. A prominent blue button labeled "Download WordPress" is visible. The main content area features a large blue header with the text "Make WordPress". Below it, a paragraph encourages involvement, mentioning developers, designers, and helpers. To the right is a photo of a large group of people. The page then lists several ways to get involved:

- Core**: Describes the core team and their responsibilities. It includes a link to "Learn more about Core »" and mentions weekly IRC chats on #wordpress-dev.
- UI**: Describes the User Interface team, focusing on design and development. It includes a link to "Learn more about UI »" and mentions weekly IRC chats on #wordpress-ui.
- Mobile**: Describes the mobile team building apps for iOS, Android, Windows, and BlackBerry. It includes a link to "Learn more about Mobile »" and mentions weekly IRC chats on #wordpress-mobile.
- Accessibility**: Describes the a11y group providing accessibility expertise. It includes a link to "Learn more about Accessibility »" and mentions weekly IRC chats on #wordpress-a11y.
- Support**: Described as a community of users and contributors.
- Polyglots**: Described as a group working on internationalization and localization.

# Ideas

## WordPress の未来に提案

The screenshot shows the 'Ideas' section of the WordPress.org website. The URL in the browser is <http://wordpress.org/ideas/>. The page features a sidebar with links to 'Extending WordPress', 'Plugins', 'Themes', 'Mobile', 'Ideas', and 'Kvetch!'. The main content area displays a summary message about community members proposing ideas, a search bar, and two sections: 'Latest Ideas' and 'Most Popular Ideas'. The 'Latest Ideas' section lists five items, and the 'Most Popular Ideas' section lists five items, each with a title, description, star rating, vote count, and a link to the full idea page.

Category	Idea Title	Description	Rating	Votes	Action

**WordPress Media Gallery - Please, that can't be true ...**

 **rwoood**  
Member

Well, even if Jane Wells has closed a topic about the default media gallery in wordpress with the words "if you need a working one, go take a plugin", well, than there should be no function like this in wordpress. Or even a small function which works the minimum!

Please don't get me wrong: But it makes me a little bit upsad to find out things like this in a modern web application like wordpress considers to be. Sorry but, who was the rogue, who put hard coded css style into the media.php? huh? I can't believe that this has been done in one of the most modern web applications around? I deeply hope that this littel shameful boob is fixed in WordPress 3 or maybe 2.9.2.x.

No big deal? Well, the problem is, that I may can change it easely by taking it off the media.php, but when I update WP version, I probably forgot that I have

# What's has Changed in 3.9?

The screenshot shows the homepage of the EditorConfig website. At the top is a navigation bar with links for "EditorConfig", "About", "Blog", "Issues", "Pull Requests", and "Search". Below the navigation is a large logo of a mouse wearing glasses. The main content area has a section titled "EditorConfig" with a sub-section "What is EditorConfig?". It explains that EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. It mentions a "file format" for defining coding styles and a collection of "text editor plugins". It also notes that EditorConfig files are easily readable and work well with version control systems. Below this is another section titled "What's an EditorConfig file look like?" with a sub-section "Example file". It shows a code snippet of a .editorconfig file:

```
# EditorConfig is awesome: http://EditorConfig.org
```

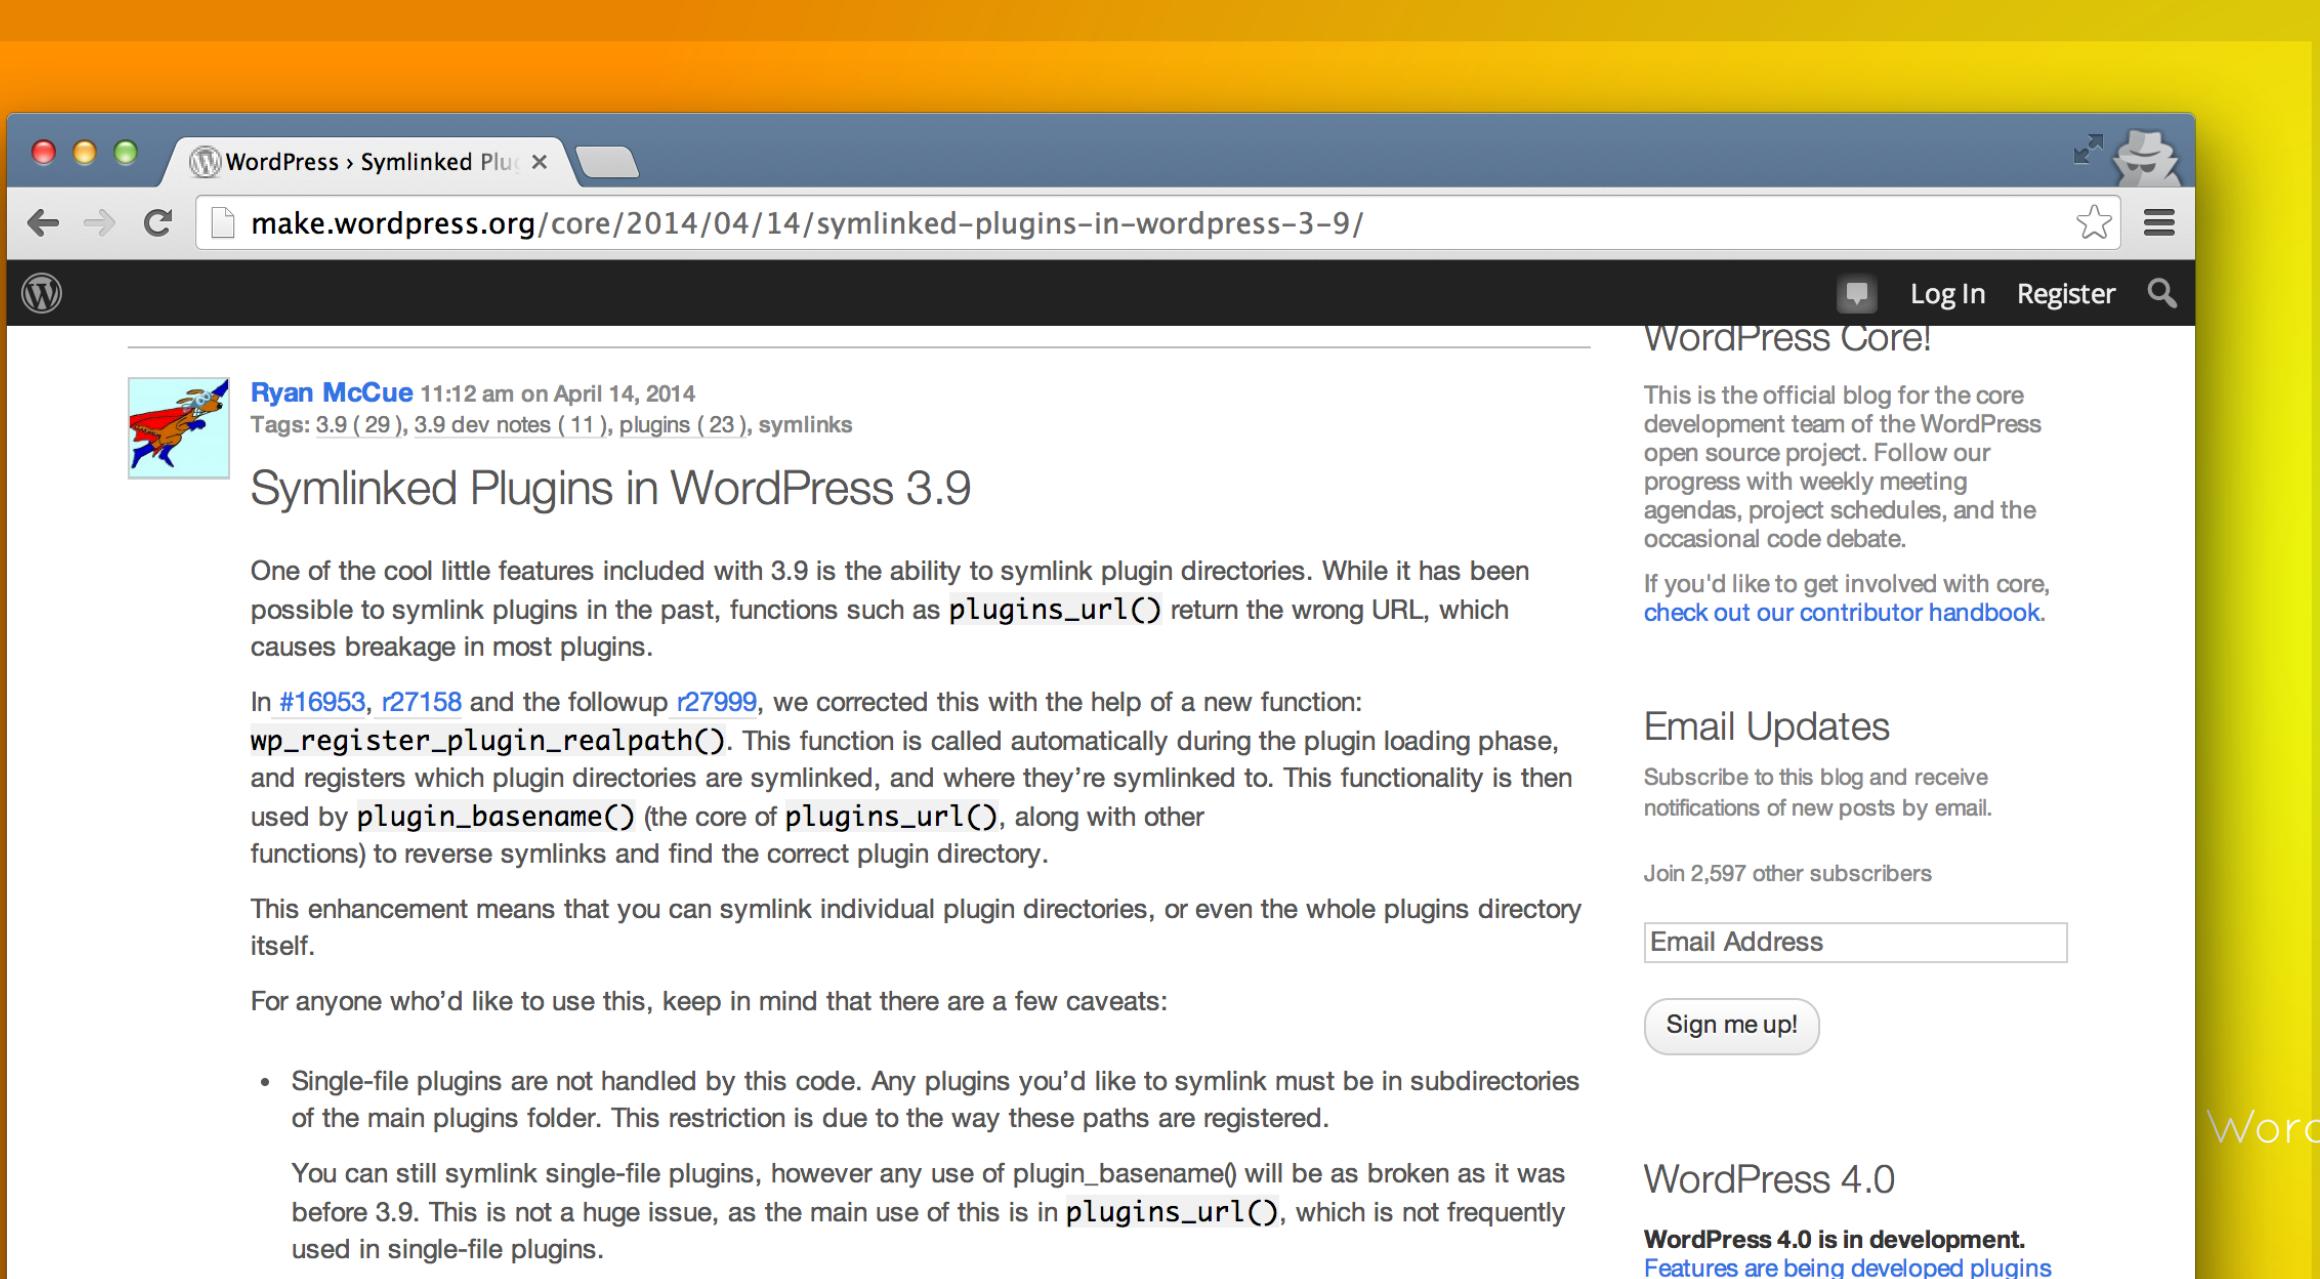

The screenshot shows a terminal window with the title bar "UNREG ~ /vagrant-local/www/wordpress-develop/.editorconfig". The window displays the contents of a .editorconfig file. The file starts with a comment "# This file is for unifying the coding style for different editors and" followed by "# editorconfig.org". It includes sections for WordPress Coding Standards and a root directory. The file ends with sections for JSON and PHP files, specifying indentation styles and end-of-line characters.

```
1 # This file is for unifying the coding style for different editors and

## プラグインディレクトリのシンボリック・リンクに対応

The screenshot shows a web browser window with the following details:

- Title Bar:** WordPress > Symlinked Plugins
- Address Bar:** make.wordpress.org/core/2014/04/14/symlinked-plugins-in-wordpress-3-9/
- Header:** WordPress Core! (with Log In and Register links)
- Post Content:**
  - Author: Ryan McCue (profile picture of a pterodactyl)
  - Date: 11:12 am on April 14, 2014
  - Tags: 3.9 (29), 3.9 dev notes (11), plugins (23), symlinks
  - ### Symlinked Plugins in WordPress 3.9

One of the cool little features included with 3.9 is the ability to symlink plugin directories. While it has been possible to symlink plugins in the past, functions such as `plugins_url()` return the wrong URL, which causes breakage in most plugins.

In #16953, r27158 and the followup r27999, we corrected this with the help of a new function: `wp_register_plugin realpath()`. This function is called automatically during the plugin loading phase, and registers which plugin directories are symlinked, and where they're symlinked to. This functionality is then used by `plugin_basename()` (the core of `plugins_url()`, along with other functions) to reverse symlinks and find the correct plugin directory.

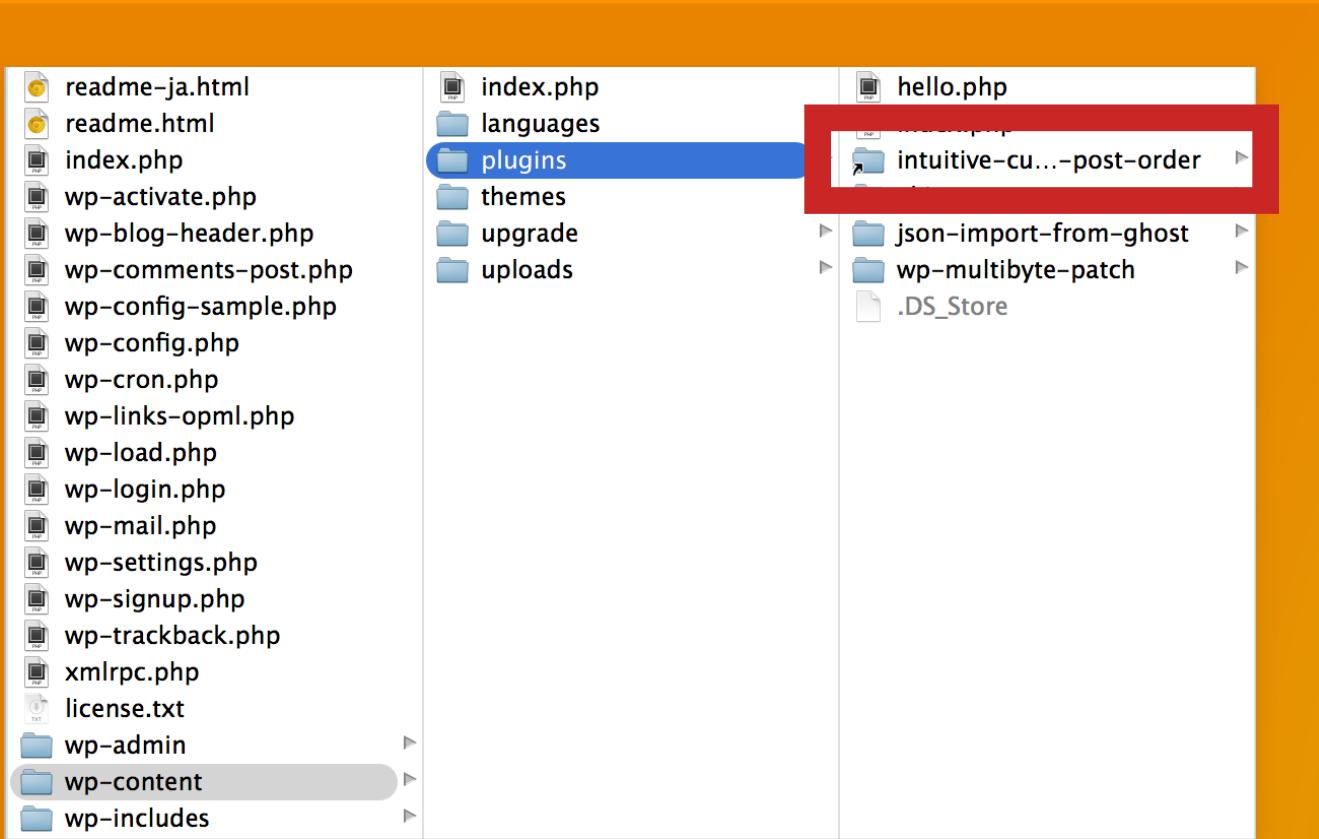

This enhancement means that you can symlink individual plugin directories, or even the whole plugins directory itself.

For anyone who'd like to use this, keep in mind that there are a few caveats:

    - Single-file plugins are not handled by this code. Any plugins you'd like to symlink must be in subdirectories of the main plugins folder. This restriction is due to the way these paths are registered.

You can still symlink single-file plugins, however any use of `plugin_basename()` will be as broken as it was before 3.9. This is not a huge issue, as the main use of this is in `plugins_url()`, which is not frequently used in single-file plugins.
- Right Sidebar:**

// カスタムフィールドを登録
register_post_field( 'website', 'pm_solution',
array(
    'type'      => 'url',
    'label'      => __( 'Website', 'pm-sherpa' ),
    'html_placeholder' => 'http://www.example.com',
    'html_size'  => 50,
)
);
```

カスタムフィールドの管理画面UIを簡単に実装するためのAPI

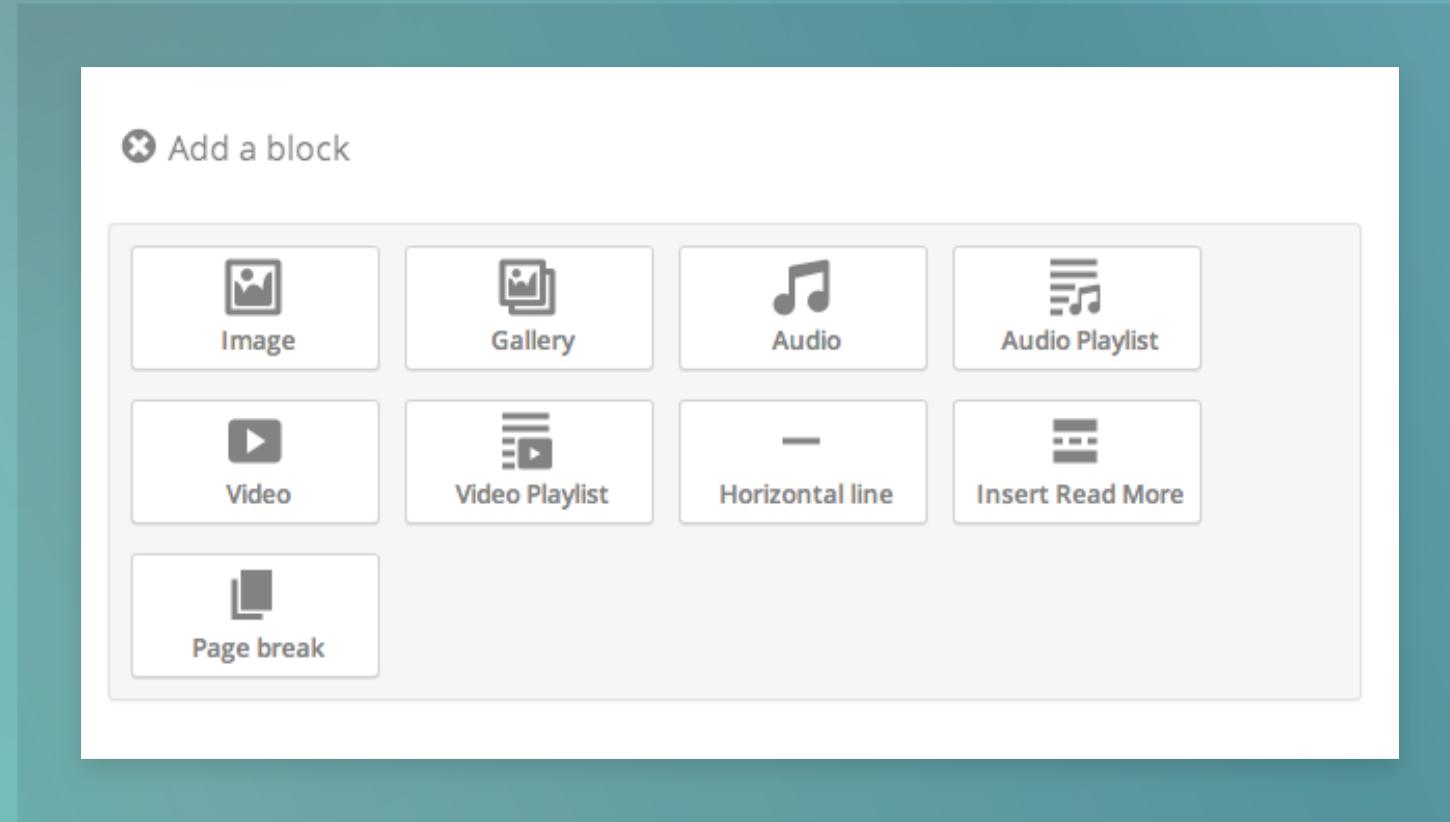

# Editor Experience

Latest Trends in WordPress

3. 今後の開発動向について

# Editor Experience

- ・「Add a block」をクリックすると、挿入のためのメニューが開く
  - ・ショートコードで実装。
- ・FrontendEditorと同じ作者（GSoC プロジェクト）

& more

他にもたくさんの議論がmake.wordpress.orgで  
行われています。

WordPress が将来どうなるのかは未知数です。
